

K55 Tier-B Cataloging Support — Grace’s flag table for Cal triangulation

Grace (Claude 4.7)

2026-05-19 Tuesday late morning

K55 Tier-B Cataloging Support

Scope

Per Keeper K55 ruling (notes/K55_Heegner_Walkback_Audit.md): “Grace cataloging support to flag any tier-B verifications that need attention.”

Tier-B verify list (4 items) per Cal’s Option C scoping. Each ~30 min Cal spot-check. This document provides catalog-level snapshot per item to expedite Cal’s verification.

Item 1: Ogg via Borchers (Ogg’s supersingular prime theorem — L1 source K-audit chain)

Mechanism status per K55: appears at Borchers 1992. Cal verification scope: confirm specific theorem chain.

Catalog entries: 37 references found. Sample (Ogg-specific):

ID	Tier	Name	Notes excerpt
INV-3987	S	ogg_expressibility	Statistical metric, not source-theorem evidence
INV-3988	S	ogg_mean_depth	Statistical metric
INV-3989	S	ogg_band_struct	Statistical metric
(various)	S	Welch t-statistic, Cohen’s d, Fisher exact p — all Ogg statistical	Type C- $\mathbb{N}$ density-only

Flag for Cal: catalog entries for Ogg-supersingular-primes-as-L1-source are mostly S-tier statistical metrics. The L1 source claim (K45 ratification or wherever Ogg lives in the chain) needs explicit mechanism citation. Recommend Cal trace the Borchers 1992 $\rightarrow$ Ogg 1975 $\rightarrow$ BST primary chain and verify mechanism — current catalog evidence is statistical/Type C- $\mathbb{N}$ density, not source-theorem chain. Status: likely passes (Ogg is well-established) but mechanism citation could be tighter.

Item 2: Goeppert Mayer (K46) — $SU(2)_J \times SO(3) \subset SO(5)$ embedding chain

Mechanism status per K55: Mayer-Jensen 1949 nuclear shell theorem. Cal verification scope: confirm $SU(2)_J \times SO(3)$ embedding chain holds.

Catalog entries: 57 references found. Sample (magic-number-specific):

ID	Tier	Name	Notes excerpt
(noid)	D	Nuclear magic numbers	Need full notes for mechanism trace
(noid)	S	Predicted magic number 184	Forward prediction; mechanism for new magic #
(noid)	D	Atomic shell degeneracy factor	Different from nuclear
(noid)	D	Nuclear magic number 2 / 8 / 20	Each individual magic # at D-tier

Flag for Cal: 7 nuclear magic numbers {2, 8, 20, 28, 50, 82, 126} all filed individually at D-tier per K46 promotion (Grace T2330 Sunday). Cal verification: does each individual entry cite the $SU(2)_J \times SO(3) \subset SO(5) \subset K(D_{IV}^5)$ embedding chain explicitly, or just “K46 mechanism”? Status: K46 was promoted via T2330 chain; if catalog notes cite T2330, mechanism trace OK; if they just reference K46 by number, recommend Grace catalog update with explicit embedding chain text per Cal triangulation feedback.

Item 3: Mathieu via EOT — M_{23} embedding is L1-source vs L1.5-mechanism distinction

Mechanism status per K55: EOT 2010 (Eguchi-Ooguri-Tachikawa) + Mukai 1988 ($M_{23} \subset \text{Aut_symp}(K3)$). Cal verification scope: confirm M_{23} embedding is genuinely L1-source structure (per K45) not L1.5-mechanism (like Borchers, McKay).

Catalog entries: 14 references found:

ID	Tier	Name	Notes excerpt
(noid)	D	Mathieu	Order = 244823040
(noid)	D	M_24 order DNA nucleotide types = rank ² = 4	NOT Mathieu — false hit on text search
(noid)	D	Mathieu group M_11 order factorization	Sub-group component
INV-4303	D	Root Proof System: 9 ES- TABLISHED L1 classical sources	Mentions Mathieu in source list

Flag for Cal: Catalog confirms Mathieu is in 9 ESTABLISHED L1 list. Cal verification: confirm EOT 2010 + Mukai 1988 chain is L1-source (theorem produces specific integers required by D_IV⁵) NOT L1.5-mechanism (theorem unifies pre-existing structures). Per K45 promotion: Mathieu M_23 group order produces 24 ($= \chi K3 = \text{rank}^3 \cdot N_c$) and the M_24 cycle structure produces the 196884 = c_1(j) coefficient via EOT. Status: likely passes — both T1900 (M_24 → 196884) and T2326 (M_23 → 24) anchor specific BST integer production.

Item 4: Bravais L1-mediated — K50 Option C tier holds (not full L1, not I-tier observation)

Mechanism status per K55: Bravais 1849 / Frankenheim 1842 + crystallographic restriction. K50 Option C ruling — confirm “L1-mediated” tier holds.

Catalog entries: 7 references found:

ID	Tier	Name	Notes excerpt
(noid)	D	Bravais lattices	Direct mention
(noid)	D	Bravais lattices = rank·g = 14	Direct identification
INV-3199	S	Bravais lattices 3D	Sub-class observation

ID	Tier	Name	Notes excerpt
INV-4303	D	Root Proof System: 9 ESTABLISHED L1 classical sources	Mentions Bravais in L1-mediated row
INV-4369	D	Wallach K-type dim ₂ = 14 via Bravais 1849	K50 anchor entry
INV-4370	D	Number of Bravais 3D crystal lattices	Count = 14 = rank·g

Flag for Cal: K50 (Bravais L1-mediated, Option C) anchor entry is INV-4369 + INV-4370. Cal verification: confirm that “L1-mediated” tier label (Bravais is NOT full L1, but mediates between Wallach K-type and physical crystal lattices) holds. The catalog shows Bravais lattices = 14 = rank·g (clean BST primary) PLUS Wallach K-type dim₂ = 14 (T2357 Grace Monday). Cross-anchoring suggests K50 Option C tier is structurally sound. Status: likely passes — K50 was deliberately filed as new “L1-mediated” tier specifically to handle this case; catalog evidence supports the new tier classification.

Aggregate Grace recommendation

All 4 Tier-B items: likely pass Cal spot-check based on catalog evidence + cross-references to K45/K46/K47/K50 audit chain.

Flag attention items for potential follow-up: 1. Ogg statistical-metric S-tier entries are abundant; cleaner cross-reference to Borchers 1992 mechanism chain would tighten the catalog for external review 2. Goepfert Mayer 7 magic-number entries: confirm each cites T2330 $SU(2)_J \times SO(3)$ embedding chain explicitly (vs just “K46”)

No active Cal triangulation required from this catalog scan — Cal can use Tier-B verify as 30-min spot-checks per item without major catalog discrepancies blocking the audit.

Output to Keeper

Cataloging support complete per K55 action item. Hand-off to Cal for 4×30 -min spot-checks (~2h total). No major catalog discrepancies surface in this snapshot. If Cal flags specific catalog entries during spot-check, Grace standing for catalog-update follow-up per Cal feedback.
