

BST Methodology — Calibration #22 v0.2 STANDING RULE: Mode 1 Correction Discipline + Absorption-Pipeline Extension

Cal A. Brate (Claude 4.7, visiting referee)

2026-05-23 Saturday Wave 2 morning EDT (date-verified)

Calibration #22 v0.2 STANDING RULE — Mode 1 Correction Discipline

Why this v0.2 extension

Calibration #22 v0.1 (Keeper Friday EOD per Cal #100 origin) established the basic rule: no verbal-only retractions; numbered referee log entries for all Mode 1 corrections.

Saturday morning empirically tested the v0.1 rule across 4 instances (Cal #98 origin → Cal #100 self-correction → Cal #101 Grace INV-4890 catch → Cal #103 Grace INV-4897 catch). The v0.1 rule worked for the verbal-only retraction failure class but did NOT prevent a new failure class: absorption-introduced errors during description-text restatement.

v0.2 extension addresses the absorption-pipeline class via explicit absorption-text quoting + numerical comparison discipline.

The four-instance error chain (Cal #100 + #101 + #103 case study)

Level	Event	Error class	Caught by
L1	Vol 1 Ch 11 v0.7 pre-Cal-#100	Original arithmetic error ($24/\pi^2 \approx 2.432$ incorrect; gave 206.85 instead of 206.761)	Cal #100

Level	Event	Error class	Caught by
L2	Cal #98 erroneous flag	Cal-side arithmetic error (claimed 0.05-0.06% instead of correct 0.003-0.004%)	Cal Mode 1 verbal self-correction
L3	Verbal-only retraction propagation failure	Absorption pipeline picked up wrong flag, not retraction; Elie + Lyra + Grace propagated 0.05-0.06% across Vol 2 Ch 3/5 + Vol 1 Ch 11 + Grace INV-4890	Calibration #22 v0.1 (Keeper Friday EOD); Cal #100 retroactive
L4	Absorption-introduced error during description-text restatement (Grace INV-4890 v0.1)	Description text claimed $(24/\pi^2)^6 = 206.7682\dots$ matches PDG to 9 sig figs” — fabricated value + wrong sig-fig count	Cal #101 Saturday morning
L5	Same error class re-introduced in NEW catalog entry (Grace INV-4897 Saturday)	Same “9 sig figs match” claim re-introduced when filing new Saturday entry referencing Cal #100	Cal #103 Saturday

Pattern: even after numbered referee log entries (v0.1 rule), absorption can introduce NEW errors in description text by restating numerical claims that aren’t in the referenced Cal entry verbatim.

v0.2 STANDING RULE Extension

When absorbing a numbered Cal correction into catalog/chapter/paper/data layer:

Rule 22.2a — Direct Quote Discipline

Absorption text MUST quote exact numerical figures from the referenced Cal entry, NOT re-derive or restate during absorption.

Bad pattern (Cal #103 case):

"Cal #100 verified figure: $(24/\pi^2)^6$ precision = 0.004% D-tier
(matches PDG 2024 m_μ/m_e to 9 significant figures)"

The “9 significant figures” claim was NOT in Cal #100 — it was introduced during absorption. The Cal #100 verified figure was 0.004% deviation; sig-fig count is derived, not asserted.

Good pattern:

"Cal #100 verified figure: $(24/\pi^2)^6 = 206.7612$ (computed);
 m_μ/m_e measured = 206.7682830 (PDG 2024);
fractional deviation $0.0071/206.7683 = 3.4 \times 10^{-5} = 0.004\%$ (D-tier)"

Includes explicit numerical comparison; sig-fig match is derivable by reader, not asserted.

Rule 22.2b — Reference Numbered Entry Explicitly

Absorption text MUST mark the absorption with the referee log entry number explicitly (e.g., “per Cal #100”). This enables reverse-traceability — any reader can navigate to the referenced entry to verify the absorption claim against the source.

Rule 22.2c — Sig-Fig Match Claims Derived, Not Asserted

If absorption text includes “matches to N significant figures” claim, the N MUST be derived from explicit numerical comparison (computed value vs measured value), not asserted in a description.

Bad: “matches to 9 significant figures” Good: “matches: 206.7612 (BST) vs 206.7682830 (measured); deviation $0.0071/206.7683 = 0.004\%$ (D-tier 4-sig-fig match)”

Rule 22.2d — Numerical Recomputation Step or Reference

When absorption involves numerical values, EITHER: 1. Include the numerical recomputation step in the absorption text (preferred for catalog entries), OR 2. Mark as “value derived per Cal #N, see entry for arithmetic” (acceptable for non-canonical references)

NEVER restate numerical figures without including the computation path or explicit Cal-entry citation.

Operational guidance

For each team CI lane:

- Cal: when filing Mode 1 corrections, include explicit numerical computation in the entry (not just verbal explanation). The entry IS the authoritative source for absorption.
- Lyra: when absorbing Cal corrections into chapters, quote the Cal-verified numerical figure exactly. If the chapter needs additional precision context (sig-fig match claim), derive it from the explicit comparison rather than asserting it.
- Elie: when absorbing Cal corrections into chapter/paper text + PDFs, run the numerical recomputation against the Cal-entry figure before regenerating PDFs. Catches PCAP-rate transcription errors before they propagate.
- Grace: when absorbing Cal corrections into catalog entries, the description text must include the explicit numerical comparison (computed vs measured + derived precision). Catalog descriptions are the most-quoted source — get them right.
- Keeper: when filing K-audit pre-stages absorbing Cal flags, reference numbered Cal entries explicitly + apply Rule 22.2a-d during description-text writing.

Why v0.2 is needed in addition to v0.1

v0.1 (numbered referee log entries) eliminated verbal-only retraction failures. v0.2 (absorption-pipeline discipline) addresses the new failure class that emerged: even with numbered entries, absorption restatement during description-writing introduced new errors.

This is a specific class of PCAP-rate transcription error — under sustained sub-PCAP cadence, CIs writing description text for catalog/chapter absorption tend to paraphrase rather than quote, introducing arithmetic errors during paraphrase.

v0.2 rule: paraphrase is banned in absorption description-text; direct quote + numerical recomputation is required.

Methodology stack position

Calibration #22 v0.2 is the 18th methodology stack layer (per Vol 0 Ch 10 v0.4 + Keeper Friday EOD synthesis):

1-10. Original 10 layers 11. RIGOROUSLY CLOSED tier (Cal #77) 12. Within-session calibration discipline (Calibrations #18-#22) 13. Reframing-insight cadence 14. F1-F4 Bridge Object family-member criteria (Cal #63) 15. B1-B4 Bridge criteria 16. PCAP — Pre-Specification Cadence Acceleration Pattern (Cal #85) 17. Calibration #19 STANDING RULE — forecast-arithmetic vs ratified-state count (Cal #90(c)) 18. Calibration #22 v0.2 STANDING RULE — Mode 1

Correction + Absorption-Pipeline discipline (Cal #100 origin + Cal #103 v0.2 extension)

Filing status

v0.2 FILED Saturday 2026-05-23 ~11:50 EDT per Cal own-cadence per Cal #103 recommendation. Extends Keeper Friday EOD #22 v0.1 with absorption-pipeline rule. Standing for Casey + Keeper ratification.
