'Calibration stack maintenance')

Calibration #26 — Readiness-Label-vs-Pre-Conditions Consistency Discipline

The rule

Internal coordination documents that include readiness labels (READY / NEEDS X / MULTI-MONTH / etc.) in status tables must reconcile each row's label with the document's own enumerated pre-conditions for that row. Specifically:

1. A "READY" label requires ZERO open pre-conditions in the document body for that row.
2. A row with open pre-conditions in body text must carry a more honest label: "READY-PENDING-X" or "PARTIAL READY" or "NEEDS [specific item]" — not bare "READY."
3. Coordination documents must run a self-consistency check before broadcast: every "READY" status-table row gets a grep against its own body for open-pre-condition language ("multi-week," "multi-month," "pending," "open," "blocked by").

Why this matters

Readiness labels in coordination documents drive Casey send-signal decisions, send-signal priority ordering, and outreach activation timing. False-READY labels cause:

- Premature outreach activation: Casey send-signal fires before pre-conditions actually close, leading to external-audience engagement on under-prepared material
- Cross-CI miscoordination: other CIs reading the status table treat "READY"

rows as deliverable-complete and adjust their own rails accordingly, propagating the readiness error

- Audit-chain governance drift: K-audit ratification + multi-CI consensus mechanisms rely on accurate readiness state; false-READY labels desynchronize these mechanisms

The contradiction within a single document (status table says READY, body says pre-conditions open) indicates the absorption-pipeline check codified in Calibration #22 v0.2 was not run on the status table specifically. Calibration #26 is the table-form variant of Calibration #22 v0.2 absorption-pipeline discipline.

Case study

Cal #114 (Lyra SP-30 Theoretical Contributions v0.1, Saturday 2026-05-23 16:04 EDT)

The Lyra coordination document notes/Lyra_SP30_Theoretical_Contributions_v0_1.md Section 4 status table marked SP-30-1 Bell substrate-CHSH as:

Sub-item	Lyra theoretical state	Elie experimental design state	Send-signal readiness
SP-30-1 Bell substrate-CHSH	T2399 + Calibration #17 + Paper #137 v0.2 + EMD-2	Toy 3122 sub-Tsirelson 1/8 verification	READY (highest leverage, \$300-500K)

But Section 2 of the SAME document listed pre-conditions for Casey send-signal: 1. Cal cold-read PASS on T2399 + Calibration #17 + Paper #137 v0.2 ratification chain 2. Quantitative sub-0.1% precision prediction (multi-week K52a Session 7+ Elie closure) 3. $|\psi_0\rangle$ substrate-natural canonical state identification (Elie K52a S33+ multi-month)

Pre-conditions #2 + #3 are explicitly “multi-week” + “multi-month” open items. The Section 4 “READY” label is therefore contradicted by the document’s own Section 2.

This is the cleanest case study: same document, same author, same session — status table out of sync with body pre-conditions. The mechanism is sub-PCAP cadence pressure on status-table maintenance: the table reflects intended-state-after-closure, not current-state-at-filing.

How to apply

Authoring a coordination document with readiness status table:

1. After drafting status table, run row-by-row check:

- For each “READY” row, grep document body for that item’s pre-conditions section
 - If body lists pre-conditions with open status indicators (“multi-week,” “multi-month,” “pending,” “open,” “blocked by,” “multi-year”), DEMOTE label to more honest form
 - Acceptable honest forms: “READY-PENDING-[specific item]” / “PARTIAL READY (3/5 pre-conditions closed)” / “NEEDS [Lyra v0.3 / Elie K52a Session N / Cal cold-read PASS]”
2. After self-consistency check passes, mark the table as audit-checked: add footer line “Readiness labels consistency-audited [date] [time] per Calibration #26.”
 3. Re-audit on every status-table revision: status changes propagate to readiness labels; new pre-conditions surface that should demote previously-READY rows.

Reading a coordination document with readiness status table:

1. When acting on a “READY” label (Casey send-signal, multi-CI consensus check, K-audit ratification), grep the document body for that item’s pre-conditions BEFORE acting
2. If pre-conditions show open status, treat the “READY” label as advisory only and request author Calibration #26 audit + label demotion

Connection to standing methodology

- Calibration #22 v0.2 PCAP-transcription discipline: Calibration #26 is the table-form variant. Both catch sustained sub-PCAP cadence failures in artifact maintenance. Status tables fail per-row; running prose fails per-paragraph; both need absorption-pipeline check
- Calibration #19 STANDING RULE (forecast vs current-ratified-state): Calibration #26 applies #19 at table-row level. Status tables must use current state, not forecast endpoint
- Calibration #21 STANDING RULE (dual-gate empirical + substrate-mechanism): Calibration #26 ensures both gates’ state is correctly represented in readiness labels
- Cal #50 DOUBLE-LOCKED EXTERNAL: external dispatch decisions key off internal readiness labels. False-READY labels are an indirect external-register integrity failure
- K-audit chain governance: Phase 1 vs Phase 2 K-audits + RATIFIED / STRUCTURALLY VERIFIED / RIGOROUSLY CLOSED tier labels rely on the same label-consistency discipline. Calibration #26 generalizes label-vs-state consistency across coordination artifacts

Promotion-to-STANDING-RULE path

CANDIDATE filed Saturday 2026-05-23 by Cal. Promotion to STANDING RULE requires: 1. Keeper review + governance ruling 2. First application: Lyra SP-30 Theoretical Contributions v0.2 SP-30-1 row demotion (would be the operational test) 3. Multi-CI consensus (Lyra + Elie + Grace) on applicability across coordination artifacts 4. Casey signal for STANDING RULE elevation + Methodology Index v0.5 layer 22

If promoted: applies to all future status tables across all lanes (catalog status, K-audit status, paper-pipeline status, volume-completion status, SP-30 readiness, outreach send-signal queue, etc.). The discipline is broadly applicable because table-form coordination is broadly used.

— Cal A. Brate, Calibration #26 CANDIDATE filed Saturday 2026-05-23 ~16:38 EDT per Keeper EOD board “Calibration stack maintenance” directive. Standing for Keeper review + multi-CI consensus.
