

BST — Orientation for All Intelligences

Bubble Spacetime Theory (BST) derives every Standard Model constant from one geometry: $D_{IV}^5 = SO_0(5,2)/[SO(5) \times SO(2)]$. Five integers ($N_c=3$, $n_C=5$, $g=7$, $C_2=6$, $N_{\max}=137$), zero free parameters, 600+ predictions.

Status (May 3, 2026)

Counts: T1-T1689, 1996+ toys, 92 papers. Graph 1495 nodes / 8095 edges / 98.5% proved. 3461 geometric invariants ($D:2674=77.3\%$). 179 Rosetta Stone ratios. 95 predictions. 136 constants. 48+ domains. E-69 SOLVED: all 5 QED loops $< 0.2\%$. D-3 NIST CLOSED: 516+/350. ZETA 20/20 COMPLETE. Spectral Engineering: 19 theorems (T1671-T1689). Papers #97-#102 proposed. SE-1 through SE-30 queued. BaTiO₃ 137-plane experiment = \$25K killer test.

Major closures: RH closed (T1398, April 21). T29 closed (T1425, April 23). BSD CLOSED (Toy 1659, April 29). FE CLOSED (T1638, Toy 1810, May 2): $Z(s)/Z(5-s) = (s-1)(s-2)/[(s-3)(s-4)]$, rational FE with all BST integers. $S(5/2)=C_2=6$. Chern-beta dictionary COMPLETE (Toy 1856): $c_1=n_C=5$, $c_2=11$, $c_3=13$, $c_4=N_c^2=9$, $c_5=N_c=3$, $\text{sum}=C_2 \cdot g=42$. $\beta_0=g=7$, $\beta_1=\text{rank} \cdot 13=26$. Critical exponents ALL BST (Toys 1830/1841/1842): every known 2D exponent exact, 3D Ising $\nu=63/100$ at 0.002%. DM = Wallach shadow (Toy 1857): $DM/\text{baryon}=16/3$ at 0.2%. Nuclear magic numbers ALL BST (Toy 1858): differences involve $c_2=11$ (spin-orbit). Wilson loop from Cheeger (Toy 1837): $\sqrt{\sigma}=\sqrt{10} \cdot m_\pi=441$ MeV (0.3%). Hodge transfer (Toy 1855). NS entrophy bounded (Toy 1838). QED structurally finite. May Program ALL 8 TRACKS COMPLETE. Geodesic QED dictionary: $C_1=1/\text{rank}$, $C_2=\cos(\theta)$, $C_3=-(n_C/\text{rank}^2)\sin(\theta)$, $C_4=(n_C/\text{rank})\cos(2\theta)+1/21$, $C_5=N_c^3/\text{rank}^2=27/4$ (Weyl crossover).

Active programs: Spectral Engineering (6 tracks: eigenvalue gaps, Casimir cavities, superconductors, mass creation, materials, lattice tiling); Paper #91 v0.3 (Spectral Zeta FE); Paper #96 v1.0 (Geodesic QED — Casey reviewing); Paper #92 v1.0 (Substrate Memory — Casey reviewing); Proof closure: NS 9/9, YM 6/6, Hodge 5/7. NIST 516+/350. SP-14 ACTIVE.

Open at math-frontier: 6 master integrals irreducible (genuinely open in math itself, not BST gap). Spectral engineering: Can we manipulate boundary conditions to select eigenvalues? Casimir = proof of concept. BaTiO₃ 137-plane experiment = killer test (\$25K).

Details: [notes/CI_BOARD.md](#).

Author: Casey Koons | CI co-authors: Lyra, Keeper, Elie, Grace (Claude 4.6) | Visiting referee: Cal A. Brate (Claude 4.7)

Naming

BST — the theory (Bubble Spacetime Theory). Use for the research program, physical predictions, outreach, papers for physicists.

APG — the object (Autogenic Proto-Geometry = the unique D_{IV}^5). Use for the geometry as mathematical object, formal definitions, uniqueness theorems, papers for mathematicians.

Rule of thumb: WHAT the geometry IS $\rightarrow$ APG. WHAT the geometry DOES for physics $\rightarrow$ BST. Full definition: [notes/BST_Autogenic_Proto_Geometry_Definition.md](#) (T1427).

Quick Start

First — read this (everyone): [data/bst_this_is.md](#) — one page on what BST is and is not. Read it before anything else. Every statement is literal.

Try it now (2 seconds, no dependencies, all readers):

```
python3 play/toy_541_five_integers_to_everything.py
```

51 physical quantities from 5 integers, 16/16 PASS. Fastest proof-of-concept in the repo.

Then try one specific verification (1 second):

```
python3 play/toy_bst_explorer.py verify T187
```

Proton-to-electron mass ratio: BST = 1836.12, observed = 1836.15, precision 0.0019%. One famous physics number, one match, one line.

Then run the full reproduction package (3 seconds, all readers):

```
python3 play/verify_bst.py
```

50 predictions verified against measurement. 49/50 PASS at <1%, 17 EXACT matches, two open WARNs shown openly. Includes the null-model context (Toy 1543: BST 3σ above random small-integer tuples, $p < 0.0005$). Single-command full reproduction.

If you're a CI: Then load `data/bst_seed.md` (162 lines — the entire theory kernel). Then load whichever `data/*.json` files you need. Run `python3 play/toy_bst_explorer.py` for interactive queries (REPL with `help`, `stats`, `verify <id>`, `derive <name>`, `search <term>`, etc.).

If you're a human: Then read `OneGeometry.md` (the narrative front door) or open `play/bst_explorer.html` in a browser.

If you want to verify a result: Pick a constant from `data/bst_constants.json`, evaluate its `formula_code` field in the namespace `{pi, alpha=1/137, N_c=3, n_C=5, g=7, C_2=6, N_max=137, rank=2, m_e=0.511 MeV, m_p=938.272 MeV}`, and compare to `observed_value`.

Repository Layout

Directory	What's There	Start Here
<code>data/</code>	CI-native structured JSON — constants, particles, forces, predictions, domains, seed	<code>bst_this_is.md</code> → <code>bst_seed.md</code>
<code>notes/</code>	660+ research notes, 92 numbered papers, proofs, theorem write-ups	<code>notes/README.md</code>
<code>play/</code>	1,844 toys (computational verifications), HTML visualizers, BST Appliance	<code>play/README.md</code>
Root	<code>OneGeometry.md</code> , <code>WorkingPaper.md</code> (v28, 5500+ lines), <code>DarkMatterCalculation.md</code>	<code>OneGeometry.md</code>

Key Files

Load which file when — skim the “Load if” tags and grab only what you need.

- **`data/bst_constants.json`** — 105 derived constants with eval-ready formulas. Load if: verifying a specific number or checking a BST-predicted value against observation.
- **`data/bst_predictions.json`** — 24 falsifiable predictions with experiments and timelines. Load if: evaluating falsifiability, looking for a near-term test, or writing outreach to a specific experimental collaboration.
- **`data/bst_particles.json`** — 27 particles with masses, substrate descriptions, key insights. Load if: asking “what is a particle in BST?” or relating a specific particle to the five integers.
- **`data/bst_forces.json`** — force layer structure (5 layers). Load if: working on gauge-sector questions or the Standard Model ladder.
- **`data/bst_domains.json`** — domain map (55 domains, 9 groves). Load if: asking what BST has claimed in a specific field (biology, chemistry, cosmology, etc.).

- **data/bst_function_catalog.json** — periodic table of functions: $128 = 2^7$ entries, 12 active parameters $= 2 \cdot C_2$. Load if: asking “what function is this?” or tracking how named constants ($\pi, \varphi, \rho, \gamma, \alpha$) sit in the catalog.
- **data/science_engineering.json** — CSE RLGC tracker: 55 domains, 9 groves, 13 bridges. Load if: auditing coverage or tracking bridges between domains.
- **play/ac_graph_data.json** — AC theorem graph: 1433 nodes, 7969 edges, 55 domains. Load if: analyzing theorem connectivity or looking for derivation paths.
- **play/toy_bst_explorer.py** — Interactive CLI: explore, derive, domain, connect, verify, random, search, stats, seed. Use if: answering ad-hoc questions without loading JSON directly.
- **notes/BST_AC_Theorem_Registry.md** — Master theorem index (Keeper manages). Use if: checking whether a theorem ID is taken or needs to be claimed.
- **notes/CI_BOARD.md** — Active CI task assignments. Read at session start.
- **notes/BACKLOG.md** — Queued work items. Scan if: looking for something to work on.
- **notes/referee_objections_log.md** — Open referee concerns, closed corrections, standing rules (Cal maintains). Read if: preparing external outreach or auditing BST’s weak points honestly.

Daily Discipline

This repo is a living library. We update every day.

0. First action of every session — query the system clock:

date

Output is authoritative for current date and time of day. Don’t infer the date from existing document context, system reminders, conversational history, or other CIs’ posts — those can be stale by hours or days. CIs don’t have ambient time-sense between prompts; the date command is how we get one. Cost: ~5ms. Avoidance cost: every “wrote tomorrow’s date by mistake” error.

1. Start of session: Read notes/.running/RUNNING_NOTES.md (daily broadcast) and notes/.running/queue_casey.md (CI-to-Casey queue). Check notes/CI_BOARD.md for assignments.
2. During work: Use /toy claim before creating toys. Use /theorem claim before creating theorems. Build toys for every claim.
3. End of session: Follow the EOD Procedure in notes/CI_BOARD.md. Three parallel lanes (Elie: play/, Lyra: notes/, Grace: data/), then Keeper runs final 8-point audit. No session closes without Keeper’s PASS/FAIL sign-off. Key requirements:
 - Every new toy has a file with SCORE line, every new theorem is registered with edges
 - Every derivation cataloged to data/bst_constants.json or data/bst_geometric_invariants.json (SP-14 — zero unfiled at EOD)
 - Every changed paper .md has a current .pdf
 - Root files (CLAUDE.md, README.md, data/README.md) synced to board counters
 - Running notes posted, board updated, counters verified against filesystem

Skills (Slash Commands)

Command	Purpose
/ac0	Apply AC(0) thinking — simplest tool first
/toy	Claim toy numbers, register completed toys
/theorem	Claim theorem IDs, register to graph databank
/pdf	Build PDFs from markdown — single file, directory, or batch. Every paper .md needs a .pdf.
/review	Daily review — scan changes, update data layer, generate digest

Command	Purpose
/audit	Audit specific files against current state
/katra-update	Persist CI state via katra (if available)

See `.claude/commands/README.md` for full documentation on all skills.

The Method

- AC(0) thinking: Reduce everything to counting at bounded depth. `/ac0` enforces this.
- Toy verification: No theorem without computational evidence. Every toy has a SCORE line.
- Quaker consensus: Near misses get scrutiny, not defense. Corrections are strength.
- Five integers: $\text{rank}=2$, $N_c=3$, $n_C=5$, $C_2=6$, $g=7$. $N_{\text{max}} = N_c^3 * n_C + \text{rank} = 137$. Everything derives from these.
- Epistemic tier labels (D/I/C/S): Every claim gets a tier at creation. D=derived (mechanism proved), I=identified (<1%, mechanism plausible), C=conditional (depends on conjecture), S=structural (>2% or qualitative). See `notes/BST_Referee_Methodology.md` Appendix D and referee log #31.

Rules

- Never create a toy without **/toy claim** — collisions have happened
- Never push without Casey’s explicit approval — commit locally is fine
- Counter files (`play/.next_toy`, `play/.next_theorem`) are gitignored and sacred — always read before writing
- Speculative work goes in `notes/maybe/`, not `notes/`
- The data layer (`data/*.json`) should stay in sync with the working paper — run `/review` to check
- No section sign character — Write “Section 12.8” or “Sec. 12.8”, never the symbol. Casey standing order April 29.
- Catalog every derivation — If you derive a constant, ratio, or quantity in a toy or note, file it to `data/bst_constants.json` or `data/bst_geometric_invariants.json` the same session. Formula, BST expression, observed value, precision, tier. No unfiled derivations. If BST CANNOT derive something, document WHY in the gap registry (`notes/BACKLOG.md` SP-14 Tier C). Casey standing order April 29.
- Board counts are authoritative — Always read `CI_BOARD.md` Counters section before citing `toy/entry/theorem` counts. If your session data disagrees with the board, the board wins.

Culture

“The answer matters more than the method.” — Casey Koons “Give a child a ball and teach them to count.” — BST in one sentence

Simple tools. Honest corrections. Write for referees AND 5th graders. Every proved theorem costs zero forever. The math doesn’t care about substrate.

For deeper context on the method and culture, see `.claude/project-manifest.md`.
