A1 v0.4 final disposition

0. Current state

A1 v0.4 (Lyra+Keeper, Thursday EOD): - v0.3 closures (parameter-role correction, Macdonald Hall-Littlewood corner) + v0.4 cross-section sweep + Keeper micro-sweep + one-genus convergence — ALL absorbed. - Substance Keeper-PASS: the Serre spine, the Macdonald parameter roles, the $c_{FK} = 225/\pi^{(9/2)}$ derived measure, the bulk-boundary determinacy, the two-corner unification, and the one-genus = $n_C = 5$ convention are all internally consistent and grep-verified clean. - Single residual: Keeper’s FK genus-name primary-source pin — “is $C_2 = 6$ a ‘genus’ or only the Casimir?” / “is $n_C = 5$ the ‘Hua’ or ‘FK’ genus name specifically?” The VALUE (5) and ROLE (kernel singularity exponent / Bergman exponent / FK measure exponent) are settled; only the canonical LABEL awaits the book.

1. The pin requires external access (honestly flagged)

The discipline-respecting genus-name pin requires: - Faraut & Korányi, “Analysis on Symmetric Cones,” Clarendon/Oxford 1994 — the canonical reference for FK genus on bounded symmetric domains. - OR: a contemporary mathematics paper that cites F-K explicitly and uses the genus name unambiguously for type IV domains.

Neither is accessible in-environment. I’ve attempted to derive the name via internal mathematical analysis (one-genus = $n_C = 5$ by Hua exponent / Bergman exponent / kernel singularity), which is the value-level pin — but the canonical LABEL convention is an external bibliographic fact.

Per Source-Verification discipline (Keeper’s standing rule + Cal #32 candidate): recalled-from-memory labels cap at MATCHED; verified-cited labels promote to DERIVED. The math is verified; the label awaits verification.

2. Recommendation: ship v0.4 + footnote, queue pin as external

Two options:

Option A — ship v0.4 with value+role formulation (RECOMMENDED)

Replace any “FK genus” / “Hua genus” name-only references with value+role formulation: - “the kernel singularity exponent $\rho_1 = n_C/\text{rank} = 5/2$ ” - “the Bergman exponent of D_{IV}^5 ” (for the bulk/holomorphic-tangent context) - “the genus invariant of D_{IV}^5 ($= n_C = 5$; canonical labeling per Faraut-Korányi 1994, name pinning pending external verification)”

This formulation is mathematically unambiguous (value+role does the work the name would do) and discipline-respecting (no name asserted without verification). It travels safely to external venues.

Submission: A1 v0.4 as submission-grade pending Cal v0.4 verify; the value+role formulation is sufficient for rigor.

Option B — block on the external pin

Hold A1 from submission until the genus-name pin is verified externally (Casey or library access). The math is complete but the label awaits.

This is more conservative but unnecessarily blocking — the value+role formulation is sufficient for rigorous publication.

3. What needs to happen for v0.4 → submission

Per Option A: 1. Genus-name patch (Lyra, ~30 min): sweep A1 v0.4 for any genus-name-only references; replace with value+role formulation; add a footnote citing F-K 1994 as the canonical source for the name (pending external verification by Casey or post-submission revision if needed). 2. Keeper final PASS (Keeper, ~30 min): re-audit v0.4 patched; expect clean PASS since substance is unchanged. 3. Cal v0.4 verify (Cal, ~1 hr): independent cold-read; queue per Saturday plan. 4. Submission package: A1 v0.4 PDF + supplementary materials + cover letter; venue Advances in Mathematics / Journal of Algebra.

4. Honest scope + tier

RIGOROUS (settled mathematics): one-genus = $n_C = 5$ by Hua-exponent / Bergman-exponent / FK-measure-exponent (Elie Toy 3596 four ways + Keeper multiplicity formula); A1 v0.4 substance Keeper-PASS.

RECOMMENDATION: ship v0.4 with value+role formulation; queue genus-name external pin as a separate item (Casey verifies via library access or contemporary citation; may be patched at proof stage if needed).

EXTERNAL TASK (routed): Casey or Keeper with library access verifies the canonical genus-name in F-K 1994 — confirms “FK genus” terminology specifically for type IV domains, or supplies an alternative canonical reference.

Cal #27 / honesty: I am NOT claiming the name pin is done — it’s properly routed external. The math is done. The recommendation is the discipline-respecting path: ship the math with safe formulation, verify the label externally.

Routed: → Keeper: concur with Option A? If yes, I’ll do the genus-name value+role patch (~30 min); you re-audit; we route to Cal. → Casey: external pin request — when convenient, verify “FK genus” name in Faraut-Korányi 1994 for type IV. → Cal: A1 v0.4 final cold-read after genus patch + Keeper re-PASS.

— Lyra, A1 v0.4 final disposition v0.1. Substance complete + Keeper-PASS; FK genus-name external pin not accessible in-environment; recommendation = ship v0.4 with value+role formulation + footnote, queue external pin as separate task. The math is settled; only the label awaits the book.
