

C12-C14 T-number / META audit patch v0.1 (P5.2, Cal #156 Flags A+B) — Strong-Uniqueness v1.1 label correction: C13 mis-attributes SCMP to T2468 (SCMP is T2469); Cal #99 META distinction on T2467 (Rigidity-as-Singleton is a META-theorem, not an operational null-model criterion). Corrected attributions filed for Keeper update.

C12-C14 T-number / META audit patch

0. Cal's flags

Cal #156 Flags A+B on Strong-Uniqueness v1.1: - Flag A: C13 currently labeled “SCMP coherence (T2468)” — SCMP is T2469, not T2468. T2468 is Rigidity-as-Unification. - Flag B: Cal #99 distinguished T2467 as a META-theorem (Rigidity-as-Singleton — about the uniqueness *frame*) from operational criteria (which contribute to null-model factors). C12 currently treats T2467 as an operational criterion; should be marked META-tier separately.

Both flags are correct. Filing the patch.

1. Corrected attributions

From CLAUDE.md memory: - T2467 = D_{IV}^5 Rigidity-as-Singleton (META-theorem per Cal #99) — about the uniqueness/closure of the substrate framework, not a per-property uniqueness criterion. - T2468 = D_{IV}^5 Rigidity-as-Unification (operational, multiverse loophole closed) — operational criterion: D_{IV}^5 unifies; no parallel substrates needed. - T2469 = SCMP coherence (Bell sub-Tsirelson $1/2^{N_c} = 1/8$ falsifier) — operational criterion: substrate coherence maintained, with explicit Bell falsifier.

Current v1.1 (incorrect):

C#	label	T#
C12	D_{IV}^5 Rigidity	T2467
C13	SCMP coherence	T2468 ← WRONG
C14	Bell sub-Tsirelson 1/8	T2469 ← duplicates C13 content

Corrected v1.2:

C#	label	T#	tier note
(META-C12)	D_IV ⁵ Rigidity-as-Singleton	T2467	META-theorem per Cal #99 — about the uniqueness frame, does NOT contribute to null-model count
C12	D_IV ⁵ Rigidity-as-Unification	T2468	operational; multiverse loophole closed
C13	SCMP coherence (Bell 1/2 ^N _c=1/8 falsifier)	T2469	operational; explicit falsifier
C14	(vacant; reassign or close v1.2 at C13)	—	—

OR keep numbering by re-anchoring the META separately:

C#	label	T#
C12	D_IV ⁵ Rigidity-as-Unification	T2468
C13	SCMP coherence (Bell 1/8 falsifier)	T2469
META-flag	T2467 Rigidity-as-Singleton: META-theorem (Cal #99), NOT a null-model factor	

(Recommend the second form — preserves C-numbering continuity.)

2. What changes downstream

- Null-model count: T2467 (META) does NOT contribute as an independent (1/3) factor. The independent operational criteria from this cluster are T2468 (C12) and T2469 (C13). One slot is removed from the null-model factor count.
- External citation: v1.1 currently cites “13 criteria + 4 candidates”; corrected v1.2 cites “12 operational criteria + 1 META-theorem + N candidates” — accurate per Cal #99.
- Substance: unchanged. The MATH of T2467/T2468/T2469 is intact; only the C-numbering and META-vs-operational tier marking are corrected.

3. Honest scope + tier

RIGOROUS (label / attribution): T2469 = SCMP (CLAUDE.md memory + multiple Friday CI docs); T2467 = Rigidity-as-Singleton META (Cal #99); T2468 = Rigidity-as-Unification operational (Casey-named #7 dispatched Friday afternoon).

PATCH (this doc): re-attribute C13 from T2468 to T2469; flag T2467 as META separately (not in null-model count); update external-citation count accordingly.

Substance unchanged: the Strong-Uniqueness theorem stands; only the label-level attributions corrected.

Cal #27 / honesty: this is a label patch, not a substantive change. Cal correctly caught a mis-attribution that would have miscounted the null-model factor and confused external readers about which theorem is META vs operational. Routine discipline.

Routed: → Keeper: update Strong-Uniqueness v1.1 → v1.2 with the corrected attributions; null-model count adjusts by removing T2467’s (1/3) factor (operational count drops by 1, but the META-theorem strengthens the framing). → Cal: confirm corrected attribution matches your #156 + #99; close Flag A+B. → Grace: update master ledger to reflect META-tier on T2467 (separate from operational criteria).

— Lyra, C12-C14 T-number/META audit patch v0.1. Correction: C13 was mis-attributed to T2468 (T2468 = Rigidity-as-Unification operational, not SCMP); SCMP is T2469 (Bell 1/8 falsifier). T2467 is META-theorem per Cal #99 (uniqueness frame, not operational null-model factor). Recommended v1.2 attributions: C12 = T2468 (Rigidity-as-Unification), C13 = T2469 (SCMP), META-flag T2467 separate (not in null-model count). Substance unchanged; routine label patch.
