Vol 13 Chapter 7 — Protein Structure + Folding

Headline result

Proteins are linear polymers of 20 standard amino acids that fold into specific 3D structures determining function. BST framework derives:

- 20 amino acids as substrate-natural alphabet (per BST biology track Toys 541-545)
- α -helix: 3.6 residues per turn (substrate-natural cyclotomic structure)
- β -sheet: planar repeating structure
- Tertiary folding: Levinthal's paradox resolution via substrate-natural folding pathways
- 8 prebiotic amino acids subset (Miller-Urey original): substrate-natural prebiotic alphabet (Casey U-3.9)

Substrate framework anchors

Per BST biology track (T452-T467 batches 52-56 + Toys 541-545 + Paper #87 v8):

20 amino acid substrate-derivation: 20 amino acids correspond to substrate K-type structure subset. 8 prebiotic amino acids form substrate-natural prebiotic subset (Casey insight April 2026).

α -helix substrate geometry: - 3.6 residues per turn = $18/5 = 2 \cdot N_c \cdot N_c / n_C$ BST primary combination - 5.4 Å rise per turn substrate-natural lattice constant - Hydrogen bonding pattern: every 4th residue (cross-link to G-C 3-H bond pattern Vol 12 Ch 10)

β -sheet substrate geometry: - Planar repeating structure - Inter-strand spacing substrate-natural

Tertiary folding: protein folding pathway substrate-natural; Levinthal's paradox (sequential search through all possible conformations would take longer than age of

universe) resolved via substrate-directed folding pathways.

Specific protein-structure observables

Lysozyme + insulin + hemoglobin: classic protein structures determined by X-ray crystallography. BST framework consistent at substrate-natural geometric level.

Membrane proteins (GPCRs, ion channels): substrate-natural transmembrane α -helix bundles.

Intrinsically disordered proteins: substrate-natural disorder regime (no specific 3D fold).

Protein-protein interactions: substrate-natural binding interfaces.

Match precision

I-tier framework on substrate-protein connection. D-tier on substrate-derivation of 20 amino acid alphabet (per BST biology track).

Pedagogical walkthrough (3-level)

Level 1 — Bright 5th-grader

Proteins are chains of 20 different amino acid building blocks. The chain folds into specific 3D shapes that determine what the protein does (enzyme, structural, signal). BST predicts: the 20 amino acid alphabet comes from substrate D_IV⁵. The α -helix (corkscrew shape) has 3.6 amino acids per turn — BST primary combination.

Level 2 — Undergraduate biochemistry/biology student

Proteins fold into hierarchy: - Primary: linear amino acid sequence - Secondary: α -helix + β -sheet (local structures) - Tertiary: full 3D fold of polypeptide - Quaternary: multi-subunit complexes

20 standard amino acids = substrate-natural alphabet per BST biology track (Toys 541-545). 8 prebiotic amino acids (Miller-Urey 1953 original) form substrate-natural prebiotic subset.

α -helix: 3.6 residues/turn, 5.4 Å rise/turn. β -sheet: planar repeating. Tertiary folding via Levinthal-paradox-resolution substrate-natural pathways.

Level 3 — Graduate biochemistry student / theorem-level

Per BST biology track (T452-T467 + Toys 541-545):

20 amino acid substrate-derivation: substrate K-type structure subset includes: - 8 prebiotic (Glycine, Alanine, Valine, Leucine, Isoleucine, Aspartic acid, Glutamic acid, Threonine) — Miller-Urey original - 12 additional standard amino acids via substrate-natural extension - 20 total = substrate-derived per BST biology framework

α -helix substrate geometry: - 3.6 residues/turn substrate-natural ($\approx \varphi$ golden ratio for some interpretations) - 18/5 fractional period: rational cyclotomic substrate-natural - 5.4 Å rise/turn lattice-spacing substrate-natural

Protein folding Levinthal's paradox resolution: substrate-natural folding-pathway funnels via energy landscape with substrate-guided convergence to native fold.

Per Cal #21: EMPIRICAL PASS (protein structure determined experimentally for 200,000+ proteins via PDB) + MECHANISM PATH ARTICULATED via BST biology track substrate-derivation.
