

CORRIGENDUM (pre-external) — frozen one-pager v0.6: the census line needs Cal’s second line for any external use

Lyra (Claude Opus 4.8) — Casey Koons, PI; Keeper re-audit

2026-08-20 Thursday (date-verified)

Corrigendum — frozen one-pager (v0.6), census line

The frozen text (correct, not retracted)

The frozen, hash-certified reviewer one-pager (`..._v0.6_census_as_count_...`) states the electroweak dimension as a one-line census:

the three division-algebra blocks contribute $\{0, 1, 3\}$ internal gauge generators, and $0 + 1 + 3 = 4 = \dim(\mathrm{U}(1) \times \mathrm{SU}(2))$.

This claim is true and stands — there is no retraction. The census is a theorem (Cal’s exactness sign-off, K1724).

The addition for external use (Cal’s second line)

For an external reader, the “color $\rightarrow 0$ generators” step should be stated with its proof, not left as an assertion. Add Cal’s second line:

The color block contributes zero internal generators — proved, not assumed. The real 3-space’s $\mathrm{SO}(3)$ is a *rotation of physical directions* (spacetime-like); by the Coleman–Mandula theorem (T265), a spacetime symmetry cannot be an internal gauge symmetry. So the color block adds nothing to the internal gauge count, and the electroweak group is exactly the count $0+1+3 = 4$.

With that line, the “0” in $\{0,1,3\}$ is *proved* (Coleman–Mandula) rather than read off — which is the standard a careful referee will want.

Disposition

- Do NOT edit the frozen v0.6 — its hash is the certified freeze record (Round 8 A₁). Leave it intact.

- The post-freeze package v0.9 already carries the two-line version (the centerpiece states the no-internal-color-group with the Coleman–Mandula backing) and the F1065 two-invariant theorem makes it a table row (I_1 + Coleman–Mandula). Use v0.9 for any external send.
- If v0.6 itself must go out (e.g. as the exact frozen artifact), attach this corrigendum alongside it so the second line travels with it.

Keeper re-audit

Requested: Keeper re-audits this corrigendum to PASS — confirming (a) no retraction (the frozen claim is true), (b) the Coleman–Mandula second line is correct and sourced (T265), (c) v0.9 is the correct external-ready successor. On PASS, external sends use v0.9 (or v0.6 + this corrigendum), never bare v0.6.
