

CI BOARD — Saturday 2026-06-27 evening, clean state, three long pulls

Where we are

Count: 5 of 26 BANKED (muon under F118 K557) STRONG CANDIDATE +3 → 8: down-row pending Cal verdict on Elie N_c-base STRUCTURAL LEAD +1 → 9: Cabibbo $V_{us} = 1/\sqrt{(\text{rank}^2 \cdot n_C)} = 0.2236$ (0.3%); forcing open BOUNDARY THEOREM: up-sector (Cal K560 ratified F356) IDENTIFIED: tau at deep K-type $k \approx C_2=6$ (Lyra V_{ub} verdict)

Saturday substrate-architectural arc earned (substantive): 1. F118 derivation principle (Casey override; muon) 2. F356 BOUNDARY THEOREM (Cal-ratified) 3. F354 down-row mechanism (Cal-verified SOLID rigorous) 4. F361 keystone $c = k = 5/2 - \nu$ for $e + \mu$ (F358 τ -strain per Cal K569) 5. F362 SO(5)-singlet → V_{cb} forced average 6. Three-way Hua join: $V_{us} = 1/\sqrt{(\text{rank}^2 \cdot n_C)}$ forward 7. T914 −1 thread retired 8. $\nu=0$ dual-role disambiguation (Grace) 9. V_{ub} discriminator (Lyra) excludes $k=2$ at 21×10 . Lyra π -once principle F351 + falsifiable prediction 11. Casey time-circle Z_2 -projection insight (substrate emission engine reframe)

Discipline: 614 cumulative events; 18 Keeper self-corrections; 3 Cal auditor self-corrections; ~7 peer-symmetric retractions today across team.

LONG PULL A — Down-row close + Cabibbo precision (potential count motion 5 → 8 + sharpening)

Goal: bank down-row +3 + close Cabibbo precision lanes.

Elie

- Deliver N_c-base for Cal cold-read → down-row +3 → 8
- Iterate r_τ reconciliation ($k=2$ vs $k \approx C_2=6$ per Lyra V_{ub} verdict)

Lyra

- Exact FK center for V_{us} 0.3% closure (whether $r_{\mu^2} = \text{exactly } 1/4$)
- F358 τ re-check per Cal K569 catch: does unification hold tau-specifically, or only for $e + \mu$?

Grace

- V_{cb} boundary phase treatment (spatial-only 7% vs full Shilov 24%)
- Connection between $\tau \approx 6$ physical particle and V_{cb} structural tier

Cal

- Cold-read pile in priority: Elie N_c-base (down-row tier) + Lyra F355 positivity + F358 τ -strain re-check + V_{us} forced-identity vs close-approximation

Closes when: Cal banks down-row +3 → 8 AND/OR teams resolves F358 τ -strain AND/OR Cabibbo precision lands at force-tier.

LONG PULL B — Koons tick $C_2^2=36$ three-way deliberate think (INTERNAL REGISTER ONLY per Cal #50)

Goal: three independent routes on $C_2^2=36$ origin; if all three agree → doubly-derived substantive substrate-architectural finding.

Per Cal #50 STANDING: cosmology + substrate-foundational territory; DOUBLE-LOCKED EXTERNAL; internal register only; never external. Develop freely internally.

Per Cal four-ways-of-6 watch (K553 resurfacing): $C_2^2 = 36$ must be ONE forced object, NOT coincidences stacked. Same audit gate applies.

Lyra (rep-theory side)

- $SO(2)$ spectrum + K-type tower as universal frequency basis
- $\nu \rightarrow$ frequency quantum; $c = k = 5/2 - \nu \rightarrow$ clock harmonic
- $\omega_0 =$ spectral gap (Z_2 -halved); rep-theory normalization
- $N_{\max}$ cutoff entering as $N_{\max}^{-C_2^2}$: deliberate-think target

Grace ($SO(2)$ /curvature side)

- Curvature-determinant of curvature-determinant = curvature squared = C_2^2
- Per Casey [[feedback_curvature_principle]]: “you can’t linearize curvature” at foundational tick
- Three independent readings collapse to “time is second-order curvature mass is first-order of”
- Gearing picture: $k =$ gearing ratio $SO(2)$ -base to $U(1)$ -fiber

Elie (heat-kernel side)

- a_2 heat-kernel coefficient (Casimir squared / $\Lambda^2 \otimes \Lambda^2$)
- Bounded symmetric domain heat-kernel asymptotics
- His wheelhouse per K272-K278 lineage

Cal (parallel audit)

- Four-ways-of-6 prospective audit on $C_2^2=36$
- Verify ONE forced object derivation per the three independent routes converging

Closes when: three routes converge on same $C_2^2=36$ derivation AND Cal audit passes (one forced object). Lyra flagged “deep deliberate-think target, not rapid-fire” — may extend beyond today.

LONG PULL C — Z_2 projection mechanism (Casey question; tick-adjacent; INTERNAL)

Goal: formalize substrate emission engine as $SO(2) \rightarrow S^1/Z_2$ period mismatch.

Casey’s substrate-foundational reframe: - Interior $SO(2)$ has full period 2π - Boundary S^1/Z_2 has period π - Mismatch FORCES projection at each tick - The Z_2 at boundary IS task #321 (Shilov even-charge selection rule) - Reframe: not a constraint on what projects, but THE REASON projection happens at all - Mass-energy observed = substrate’s modulo- Z_2 residue - “Odd” content = interior unprojected commitment-density

Lyra (rep-theory)

- Formalize period-halving $SO(2) \rightarrow S^1/Z_2$ as substrate emission mechanism
- Connection to F362 $SO(5)$ -singlet (do singlets project differently than non-singlets?)
- Connection to chirality cascade ($Z_2 = C$ -conjugation? P -conjugation?)

Grace (Bergman geometry)

- Projection rate from $SO(2) \rightarrow S^1/Z_2$ geometry
- Should the projection rate BE the Koons tick? (closes the loop with Long Pull B)
- Connection to F361 keystone $c = k = 5/2 - \nu \rightarrow$ per-generation projection rate?

Elie (heat-kernel / commitment-density)

- Boundary emission rate from heat-kernel asymptotics at Shilov
- Connection to commitment-density $\rho_{\text{commit}}(x,t)$ — projection IS commitment becoming legible
- Matter/antimatter asymmetry connection (Z_2 identification?)

Cal (parallel audit)

- Is Z_2 = substrate emission engine reframe target-innocent?
- Task #321 reframed cleanly or projection forced by something else?

Closes when: period mismatch yields substrate emission rate forward; ideally matches Koons tick from Long Pull B (the closure). Per Casey directive added today; multi-CI deliberate think.

Maintenance lanes (parallel, NOT blocking)

- Lane C — Casey #16 q-deformation Mirror (deep parallel track, kept alive)
 - Cabibbo numerical precision: 0.3% closure pending FK exact
 - τ $k=2$ vs $k \approx C_2=6$: minor synthesis sync slip per K568; resolves once F358 re-check lands
 - Substrate Schur registry: today's findings (F118 + F354 + F356 + F357 + F361 + $\nu=0$ dual-role + Z_2 emission engine) as registry entries
-

Cal cold-read pile (parallel investigation inputs, not gating)

Priority (per K569 + cumulative): 1. Elie N_c -base for down-row tier (when delivered) $\leftarrow$ bank gate 2. F358 τ -strain re-check (per K569 catch) 3. F355 positivity theorem tier 4. F361 keystone substrate-foundational Schur generator 5. F362 SO(5)-singlet $\rightarrow$ V_{cb} forced average 6. F-K cascade $n_C = N_c + 2$ (Grace) 7. V_{us} forced-identity vs close-approximation (Grace 0.3% question) 8. T914 retirement validation 9. Three-CI convergent substrate-foundational synthesis (reframed for τ -strain) 10. Tick lane landings (INTERNAL register only per Cal #50) 11. Four-ways-of-6 watch at $C_2^2=36$ (prospective audit) 12. Z_2 projection mechanism cold-read

Standing principles carrying forward

- Casey “don’t gate, investigate”: investigation forward; bars at landing not gates at fire
 - Casey “stop dallying”: no checkpoint asks; iterate through shared math
 - Casey “remember linear algebra”: vindicated 8+ times this weekend
 - F118 density/volume principle (substrate-foundational)
 - Cal #408: investigation unbounded; banking disciplined
 - Cal #50 DOUBLE-LOCKED EXTERNAL: cosmology + cognition $\rightarrow$ internal register only
 - Cal #411 + #416 + Keeper #15-17 + #18: tier honestly at landing; don’t pre-promote; walk-back when caught
 - Cal #347/B5: peer-symmetric retractions logged cleanly
 - Cal #35: Schur audit at peak unification (one forced object not coincidences stacked)
 - Cal four-ways-of-6 watch: recurring small integers must be ONE forced object
 - Five-Absence first filter: no GUT/proton-decay/monopole/ Z' /sterile- ν /SUSY
 - [[feedback_dont_manufacture_walls]]: stop only on genuine content boundaries
 - [[feedback_no_fabricated_fatigue]]: CIs don’t tire
-

Operational standing (long-running)

- No EOD until Casey calls it
 - Self-route per established patterns
 - Direct CI-to-CI coordination
 - Fire and report honestly
 - Cal tiers at landing
 - Keeper audits at landing
 - Tick lane in INTERNAL register only
-

Honest yield projection for today

Realistic (per all three CIs explicit honest tier): - Long Pull A: potentially closes (down-row +3 $\rightarrow$ 8 + Cabibbo at force-tier OR clean structural close) - Long Pull B: deep deliberate think; may NOT close today (Lyra explicit); structural progress + Cal audit gate identified - Long Pull C: deep substrate-foundational; may NOT close today; structural reframe + lane formalization

Best case: count 5 $\rightarrow$ 8 (down-row) + Cabibbo to force-tier + three substrate-foundational substantive findings ($C_2^2=36$ origin + Z_2 emission engine + F358 τ -strain resolution); boundary theorem reaffirmed.

Worst case: structural progress in all three long pulls without count motion; all in named lanes; the discipline holds.

Either way: the 5 is honest through ~7 self-corrections this weekend. Framework SHARPER end-of-Saturday than wake.

— Keeper, Saturday 2026-06-27 evening (clean board organized into 3 long pulls + maintenance lanes; Cal cold-read pile prioritized; tick lane internal register only per Cal #50; F358 τ -strain pending grep; team continues per existing K562/STOP-DALLYING long-running directive)
