

Team turn — 2026-07-03 next. Down-ladder is an honest negative; pivot to the clean tests.

SOD check first. The primary computation landed — as a truthful negative. Here's the honest state and the pivot.

Where we are — the down-ladder did NOT close (K651)

Lyra ran the whole product: quark mass = $d(\nu) \times k_s$. $d(\nu)$ deposit ratios = 5/3, 64; Grace's committed $k_s \in \{2,4,6,8\}$. So $m_s/m_d = (5/3) \cdot (k_2/k_1)$ needs $k_2/k_1 = 12 = 2 \cdot C_2$ — the flagged fish — which is in neither forced half. Mechanism maxes at ~ 6.7 , target 20. The down sector is NOT derived-strong. - This is the method working: Grace committed k_s *blind*, so no retrofit was possible; the beautiful 1–2% ladder match was reported as a LEAD, not banked. Down-row re-tier: strong lead, not derived-strong. Derived-strong count holds ~ 2 ($\sin^2 \theta_{13}, \theta_{12}$). - Byproduct: the 5/3 in geometry and formal degree is the *same* object (n_C/N_c) — the picture tightened even as the ladder didn't close.

The frame advanced, though — the two-layer doc now has §10: the dressing IS the volume (freeze-depth $\rightarrow$ dressing $\rightarrow$ 3D volume/compositeness $\rightarrow$ coherence). That opens a *new, cleanly-measured* test (below).

The pivot — three clean targets (the down-ladder lead is parked, forward-only)

A. Hadron charge radii — the NEW clean experimental test (Elie + Grace)

§10: point-like ∇ undressed ∇ deep/singlet; extended ∇ dressed ∇ shallow/colored. The dressing that sets the mass should also set the SIZE. Derive the proton charge radius (~ 0.84 fm) from the dressing scale ($\sim m_p/N_c$). Experiment measures charge radii cleanly and independently of masses — so if the same glue gives mass *and* size, the two-layer model is confirmed twice, on independent data. This is the highest-value new target — a real, measured, one-line-checkable prediction.

B. Force $\tau_{\text{commit}} = 2^{\{N_c\}} \cdot g = 56$ — the Λ derivation prize (Lyra + Grace)

The Λ residue ontology + heat-bleed mechanism are real (resolve the CC problem at mechanism level); the exponent is a convention-loose LEAD (spans 280–284). The prize is forcing $\tau_{\text{commit}} = 2^{\{N_c\}} \cdot g$ from SWPP commitment-dynamics — NOT reverse-reading 280 (Cal #318). Grace's lead: $2^{\{N_c\}}=8$ = the color-Fock dimension $\Lambda(C^3)$ (*the F459 commit-and-read object*) — *the vacuum's depth may carry the same color-Fock 8 as a baryon, which could make the layer-count derivable**. Neutrino $\neq \Lambda$ mechanism (power-law vs exponential) — same ontology, two mechanisms; don't merge the math.

C. The $2 \cdot C_2 = 12$ gap — forward-only, careful (Lyra, low priority)

IF a genuinely *independent* third forced factor exists (candidate: Z_2 Shilov involution $(2) \times$ Casimir ($C_2=6$)), the ladder could close. But $12 = 2 \cdot C_2$ is the flagged fish — derive it forward or leave it; never read it back from 20. Low priority vs A and B; only pursue if a truly independent forcing appears.

Per-CI

- ELIE: hadron charge-radius test (derive proton radius from dressing $\sim m_p/N_c$; top/electron point-check). Checker on any τ_{commit} forcing.
- GRACE: the color-Fock τ_{commit} lead ($2^{\{N_c\}}=8 = \Lambda(C^3)$); freeze-depth geometry (does a free-energy-with-dimension-as-order-parameter force the depths 12, 56?); charge-radius geometry side.
- LYRA: τ_{commit} forcing (SWPP, her lane); ν -scale coefficients ($\{7/12, 10/3\}$ forced?) + finish registry back-fill (fresh reads); the $2 \cdot C_2$ gap ONLY if an independent factor appears.
- KEEPER: adjudicate (charge-radius forced vs fit; τ_{commit} forward vs reverse-read; the $2 \cdot C_2$ fence); hold the two-layer + regime + §10 frame honest; SOD first.
- CAL: post-landing cold-read. α tier-call reserved for Casey.

Disciplines armed

- Honest negatives are finished answers (the down-ladder just delivered one — bank it as a lead, move on).
- Compute/derive forward, don't reverse-read (τ_{commit} ; the 2·C_2 gap).
- Dressing = volume: derive size from the same glue that gives mass (independent confirmation).
- Simplest one-line-checkable forms (ad-AI-num armor) · Five-Absence · target-innocence · σ scheme-aware · cite-don't-claim · pre-audit.

Standing for Casey

Down-row re-tier (strong lead, NOT derived-strong — K651) · two-layer + regime + freeze-depth/volume mass frame (ratify) · σ -metric + cheapness ratification · α tier-call · CLAUDE.md line 0.5.

EOD target

Proton charge radius derived-or-honest-negative from the dressing scale (the clean new test). τ_{commit} forcing attempted (forward). ν -coefficients closed-or-flagged, backfill advanced. Derived-strong grows only on a forced result — the charge radius is the best shot.

— Keeper, next turn. The down-ladder is an honest lead, not a bank — the discipline delivered the truth on a beautiful match. Pivot to the charge radius (dressing = volume, cleanly measured) and τ_{commit} (the Λ prize). Compute forward, don't reverse-read.
