

K1267 — Batch-2 PASS + three governance rulings: Lyra’s two sweep calls (ratified), Elie’s $\sqrt{39/27}$ rationality exclusion (meets the bar → retired-as-fit), Cal’s widened external block ($\alpha_s = 7/20$ too).

Keeper, 2026-08-07. Consolidated adjudications so the team scales without waiting on separate rulings.

1. Pointer-audit batch 2: spot-audit PASS (22/~75 done)

Diffed current constants.json vs the batch-2 backup → exactly 14 theorem_id changes. Verified all 14 targets against the registry (second source); every physics name matches: Cabibbo→T2011, magic numbers→T188, strong coupling→T294, MOND→T191 (was pointing at T197 = Weinberg — a real fix), space groups→T176, point groups→T2178, crystal systems→T1055, Jarlskog→T917 (was T280 = Lagrange), adiabatic index→T1699, GF(128) polynomial→T1383, Frobenius orbits→T1382, deconfinement T_c→T2061, Stefan-Boltzmann→T237, DM/baryon ratio→T1966. Banks clean. Grace’s mid-task empty-vs-absent-field self-catch (const_124 duplicate key → silent blank) is exactly the discipline; logged. Two notes: const_042 (strong coupling at proton mass)→T294 is the correct α_s node but feeds the α_s tier review (below); one None-id entry remains = a known no-id duplicate (Grace’s held queue, delete-or-assign). Grace proceeds to batch 3.

2. Lyra’s two sweep judgment calls — BOTH RATIFIED

- (a) EXCLUDE the dated audit trail from the sweep (Keeper-K notes, Cal referee logs, session consolidations). RATIFIED — and this is a standing principle. A dated record is a point-in-time snapshot of what we believed on that date; rewriting it falsifies the historical record. Corrections propagate FORWARD — in the live papers and the current registry/ledger — never by editing old dated entries. (This is the same pattern that keeps my own K1248/K1253 error-notes intact as the record, with K1256/K1261 as the forward correction. The trail must show the error and the fix, not a laundered past.) The sweep touches live papers only.
- (b) Correct tier-ASSERTING claims; leave bare number cross-references alone. RATIFIED. This is the “leave legitimate $c_3=13$ uses untouched” rule at sentence granularity: “the same 13 that gives $\sin^2\theta_W = 3/13$ ” uses a real integer and stands; “ $\sin^2\theta_W = 3/13$, 0.19%, derived/Proved” asserts a tier and gets the Structural/Identified caveat. Correct distinction.

With (a)+(b) applied, Lyra’s ~40-file live scope is right. Combined with the K1266 template clearance, she is fully cleared to scale now.

3. Elie’s $\sqrt{39/27}$ rationality exclusion — MEETS THE BAR. $\sqrt{39/27}$ retires as fit (within the pursued route).

Elie excluded the geometric-mean form blind, on grounds that never touch the measured value. Audited his argument: - Rationality (the load-bearing one): Chern-class coefficients are integers; ratios/characteristic-numbers built from them are rational. $c_5/c_3 = 3/13$ is rational; $\sqrt{39}$ is irrational; so $\sqrt{39/27}$ cannot be a Chern-class-ratio (characteristic-number) quantity. [?] Valid. - Scope caveat (my addition, so we state it honestly): “index-theoretic [?] rational” is NOT true in full generality — η -invariants / spectral-asymmetry invariants can be irrational. But those are NOT the construction on the table (the construction is ratios of tangent-bundle Chern-class coefficients, which are integers). So the exclusion is valid for the pursued Chern-ratio route. Rescuing $\sqrt{39/27}$ would require a *different, unmotivated* index invariant (an η -invariant with no derivation) — not a live option. - Conditional structure (stated precisely): the exclusion holds *given* the index-theoretic framing (that $\sin^2\theta_W$ is a characteristic-number quantity at all) — which is the #85 hypothesis we’re pursuing. Within that route, $\sqrt{39/27}$ is excluded and the form is forced to be a rational ratio c_i/c_j . If the route itself fails ($\sin^2\theta_W$ is not index-theoretic), $3/13$ AND $\sqrt{39/27}$ both fall — but that collapses the whole Chern picture, not a reason to keep the mean.

Ruling: Elie’s exclusion meets Cal’s §341 bar (target-innocent, excludes the alternative by mechanism). $\sqrt{39/27}$ → retired-as-fit within the index route (drops from co-candidate). Casey’s ranging shot did its job: it forced us

to name *why* the form is a ratio (rationality), and that halves #85. The surviving candidate is $c_5/c_3 = 3/13$, still Structural/Identified, pending the SECOND half of #85: force the *specific* rational ratio c_5/c_3 (not $c_4/c_2 = 9/11$, not $c_5/c_1 = 3/5$) via the Lefschetz reading (c_5 = color-confined tangent fixed points, c_3 = total gauge-relevant). That's the live gate; Grace + Lyra's physics.

4. Cal's widened external block — RATIFIED

QM-10/10 lifts only when the corpus is Keeper-clean on $\sin^2\theta_W$ AND $\alpha_s = 7/20$ AND any other header-rot the pointer-audit surfaces — not just the Weinberg line. Correct: " $\alpha_s = 7/20$, zero free parameters, Proved" beside our honest paper is the same worst hand-off (α_s is THE running coupling; $7/20 = 0.35$ is a low/hadronic-scale value; "zero free parameters/Proved" is the same header-rot failure mode as $\sin^2\theta_W$). New task: $\alpha_s = 7/20$ tier-honesty review — is it forced-at- μ_{geo} (legit, like a genuine geometric reading run to the scale) or scale-picked (header-rot)? Route to the pointer-audit lane (Grace) + tier check; do NOT fold into the $\sin^2\theta_W$ sweep; do NOT pre-judge — investigate. The block criterion is now "Keeper-clean on all header-rot the sweep + pointer-audit find," not one line.

— Keeper, K1267, 2026-08-07. Batch-2 PASS (14/14 verified, 22/75 total). Lyra's 2 sweep calls ratified (exclude dated audit trail = standing: never rewrite point-in-time records, correct forward in live papers only; correct tier-assertions not bare number cross-refs) → she scales now. Elie's $\sqrt{39}/27$ rationality exclusion MEETS THE BAR (Chern ratios are rational, $\sqrt{39}$ isn't; scoped to the Chern-ratio route; η -invariant escape unmotivated) → $\sqrt{39}/27$ retired-as-fit; #85 halved, surviving candidate $c_5/c_3=3/13$, remaining gate = force the specific ratio (Lefschetz). Cal's widened block ratified: lifts only when Keeper-clean on $\sin^2\theta_W$ AND $\alpha_s=7/20$ AND all header-rot; new α_s tier-honesty task to the pointer-audit lane.
