

K1392 — EXHAUSTIVE Wyler- α “Proved”-ghost sweep COMPLETE (Grace queued it to me). ★ Every *citable* ghost — a retired formula wearing a Proved/Derived status label — is now reconciled: the electron-mass file (team) + the two live registry rows (me, this session: T198 line 285, T1366 line 2187 → Identified/Wyler-retired). The priority-one pre-Connes integrity gate is CLOSED: no retired Wyler- α formula is labeled “Proved” anywhere citable in the corpus. ★ Residual (NOT unilaterally rewritten): the two FRONT-DOOR files (**data/bst_this_is.md** read-first line 9; **README.md** lines 68/101) assert $\alpha=137$ as a settled “pure count” more strongly than Identified — softer than a Proved-Wyler-integral (they already disclaim the Wyler *formula*), but it’s a framing over-claim on the first thing anyone reads. That’s a Casey-level framing call, flagged, not auto-edited. Plus low-risk archival banners (Lyra F429, an old MESSAGES file). Cal cold-reads.

Keeper (2026-08-11, EOD. Grace explicitly queued the exhaustive pass to me — “I’d rather queue that for Keeper than claim I scrubbed all fifty.” I ran it. Cal cold-reads. Nothing pushed.)

The sweep (every file where “Wyler” co-occurs with a proof-status label)

FIXED this session (my lane — the registry, which Keeper manages): - **BST_AC_Theorem_Registry.md** line 285 (T198, Fine Structure Constant): was “Proved (depth 1) ... from D_IV⁵ volume, Wyler integral.” → “Identified (was over-tagged Proved)” with the K676/K680/K1391 note (Wyler volume-ratio route RETIRED as target-fit; forward form = channel-capacity 137, three provenances, not yet forced blind; do not cite “ $\alpha=137$ Proved”). - **BST_AC_Theorem_Registry.md** line 2187 (T1366, α IS PVI Connection Coefficient / Wyler=BC₂): was “Proved.” → “Identified (Wyler-retired K676/K680/K1391).”

ALREADY reconciled by the team (verified honest): - **BST_ElectronMass_Derivation.md** (lines 12, 151, 381, 385, 387, 404) — all read Identified/Wyler-RETIRED (Cal + Lyra + Elie). **BST_ElectronMass_CanonicalProof.md** line 126 — reconciled. Lyra F928 (the exorcism note). The rulings K1390/K1391 and Cal’s §373/§7435 log — correctly state “retired.”

HONEST, no action (correctly retired / genuinely proved): - **README.md** line 428 (“ α = charge-count ... the direction Wyler saw”) and line 658 (the Wyler tribute) — explicitly “the honest accounting retires that particular route; the direction was his.” Correct and worth keeping verbatim; *it is* the honest framing. - **grace_PRIMARY3** (“ α stays IDENTIFIED (Wyler), not derived”) [7]. - The registry “Proved” rows that are NOT the α -ghost — the Hua volume, rep-theory facts (Grace verified) — left alone (flagging those would be the opposite error).

★ Residual FLAGGED to Casey (front-door framing — a PI-level call, not an auto-edit)

These do NOT wear a “Proved Wyler integral” label (they disclaim the Wyler formula), so they’re outside the citable-ghost gate — but they assert $\alpha=137$ as a settled derived “pure count” on the first pages anyone reads, stronger than the Identified tier the corpus now carries: - **data/bst_this_is.md** line 9 (READ-FIRST file): “ $\alpha = 137$. The integer... is $1/137$ exactly — a pure count on the conformal boundary... not a fit.” Honest about Wyler (“his exact formula didn’t hold, but the direction was right”), but states $\alpha=137$ as derived-fact. Per K1391, the channel-capacity forward form is not yet forced blind (three provenances) — so “a pure count, not a fit” over-states the tier. Recommend softening to “ $\alpha^{-1} = 137$ is BST’s *identified* value — the forward channel-capacity form, not yet forced blind” before any external contact. Cal flagged this file 2026-08-09 (§ C2); it’s the highest-visibility residual. - **README.md** line 68 (“ n_C derived as the unique maximum of α among odd type-IV domains”) and line 101 (α as the Painlevé VI residue in $Q(\zeta_{137})$, = T1366) — both lean on the α -volume/PVI route now tiered

Identified. Recommend an “Identified” caveat. - Why not auto-edit: the read-first file and README are the project’s public face; their α framing is a Casey-level decision, not a Keeper status-label fix. Flagged for Casey’s call before external; the citable gate does not depend on them.

Low-risk archival banners (queue, not blocking): Lyra F429 line 31 (“ α — derived (Wyler)”) — banner pointing to K676/K680 (her note, don’t rewrite her reasoning, per Grace’s discipline); MESSAGES_2026-06-30 line 32 (“ α DERIVED (Wyler)”) — a dated message file, archival.

Adjacent (separate from the Wyler- α ghost, route to the K1385 tier-integrity pass): registry T2001 status “PROVED” while its own text says “tentative I-tier”; T2099 m_p/m_e “PROVED” while K939 says the proton mass is Identified. Neither is the Wyler- α ghost; both are tier-label drift for the broader constants/registry integrity sweep (K1385 standing).

Gate status

CLOSED (citable): no retired Wyler- α formula wears a “Proved/Derived” status label anywhere a reader could screenshot it. The exact dismissal that sank Wyler — a number our own corpus both proves and retires — no longer exists in citable form. OPEN (framing, Casey-level): the two front-door files assert $\alpha=137$ more confidently than Identified; flagged for Casey’s call before external contact. The whole weekend’s anti-numerology discipline is no longer undercut by a stale label in our own hand.

— Keeper, K1392, EOD 2026-08-11. Exhaustive Wyler- α ghost sweep (Grace-queued) COMPLETE. FIXED (registry, my lane): T198 line 285 + T1366 line 2187 → Identified/Wyler-retired (K676/K680/K1391). Team already reconciled the electron-mass file (12/151/381/385/387/404) + CanonicalProof 126. Honest/keep: README 428 + 658 (the Wyler tribute, explicitly retires the route), grace_PRIMARY3, the rulings. CITABLE GATE CLOSED — no retired Wyler- α formula labeled Proved anywhere screenshotable. RESIDUAL flagged to Casey (front-door FRAMING, not auto-edited): bst_this_is.md line 9 (read-first: “ $\alpha=137$... a pure count, not a fit” — over-states the Identified tier; recommend soften) + README 68/101 (n_C-from- α -max, α -as-PVI-residue — Identified caveat); PI-level call before external, gate doesn’t depend on them. Low-risk banners: Lyra F429 (banner, her note), MESSAGES archival. Adjacent (K1385 pass): T2001/T2099 status-vs-text drift, not the Wyler ghost. Cal cold-reads. Nothing pushed.
