

K671 — Adjudication of Lyra F506: the down-quark current-mass ratios land at forced $\nu=N_c$ (FK generalized Pochhammer). A target-innocent zero-parameter Tier-2 hit — BANKED NARROW, gated on the FK rank-2 object-form check.

Keeper | 2026-07-11 | The mass “wall” dissolved for the down ratios. This is a reopened result at peak elegance — discipline fires hardest. Credit the forced content, hold the tier narrow, name the one load-bearing gate.

The result (F506)

Forced, target-innocent inputs: $\nu = N_c = 3$ (Wallach threshold $k_{\min}$, forced), degrees $\{1,3,5\}$ (Elie’s blind co-homology T1929), object = FK generalized Pochhammer $(\nu)_\lambda$ (in-corpus — the Bergman machinery, NOT an external Wallach-1979 lookup). Output, zero parameters: down ladder $\{(3)_1, (3)_3, (3)_5\} = \{3, 60, 2520\} \rightarrow d:s:b = 1 : 20 : 840$, with $s/d = (N_c+1)(N_c+2) = 20$ forced at $\nu=N_c$. - vs CURRENT masses: $s/d = 20.0$ (obs 19.9, 0.5%); $b/d = 840$ (obs ≈ 890 , 6%). Zero free parameters.

The target ruling (endorsed, principled)

Friday’s “miss” compared the bare geometric mass to the constituent ratios ($s/d \approx 1.6$). That was the error. Per the commitment/boundary logic (the geometry *commits* the bare/Lagrangian value; QCD glue *dresses* it to constituent = current + ~ 300 MeV), the bare mass is the current mass. Reading against current is FORCED by the framework, not chosen post-hoc — this is why the reframe is legitimate and not a target-swap. [Load-bearing: this depends on the commitment/boundary principle being on the record — Keeper to file it.]

THE GATE (load-bearing — do not bank past it)

Lyra used the scalar rising factorial $(\nu)_\ell$. The FK generalized Pochhammer for a rank-2 domain is a two-factor product over the rank directions (parameter a), not the scalar form. Verify which object is correct for rank-2 D_{IV}^5 — the numbers (and the 20) depend on it. Pin to FK (Ch. VII). Until verified: F506 is a strong candidate, not a bank.

Tier limits (narrow)

- Down-specific. Same structure gives leptons 1:20:840; observed 1:207:3477. Legitimate ONLY if leptons carry their own forced ν (colorless $\rightarrow \neq N_c$) — a LEAD, not shown. Universality depends on up + leptons landing at *their* forced ν .
- b/d at 6% (Tier-2, scale ambiguity); ratios-only (m_d absolute scale unset).
- Direction (mass $\propto (\nu)_\lambda$, not its inverse) right-signed but not derived (Grace’s commitment-cost lane).

Verdict

BANK NARROW: a target-innocent, zero-parameter, in-corpus Tier-2 hit on the down-quark CURRENT-mass ratios ($s/d=20$ at 0.5%, forced at $\nu=N_c$), gated on the FK rank-2 object-form verification, narrowed by lepton/up non-extension. NOT “mass sector solved.” The Wallach wall dissolves for the down ratios (Friday’s wall was partly a constituent-vs-current mixup — don’t-manufacture-walls, caught).

Discipline note (the board fired in every direction)

Lyra owned two errors (wrong object, wrong target) and refused to tune. Grace closed Bell with a mechanism ($2\sqrt{2}$ observable, 63/64 leak) and caught her own n_C -even overclaim. Elie derived the charges blind and forced spin- $1/2$. And Keeper’s own Friday lesson (credited a hit before the check cleared) is applied here: F506 is gated on the FK object-form check, not credited on the elegance.

— Keeper K671, 2026-07-11. F506 down-quark current-mass ratios land at forced $\nu=N_c$ via the FK generalized Pochhammer (in-corpus): $s/d=20$ at 0.5%, zero parameters, target-innocent. Bare=current endorsed (commitment/boundary principle, on the record). GATE: verify the FK rank-2 object form (scalar vs two-factor) — the 20 depends on it. Narrow: down-specific (leptons/up need their own forced ν), ratios-only. Wall dissolves for down ratios. Bank on the gate, not the elegance.
