

K844 — CORRECTION to K843 (Grace’s catch): the descent $\Delta=\hat{D}+d$ gives the K-TYPE/POSITION ($d=4$ = spacetime dim, FORCED), NOT the mass. The MASS is the OVERLAP (super-linear Γ -ratio) — the linear-Casimir-as-mass reading was already caught DEFECTIVE (K663, 07-06). The overlap is super-linear (right shape for leptons $\{1,207,3477\}$); the linear Casimir can’t be. BONUS: the same overlap at the down-quark strata gives $\{1,20,900\} \rightarrow$ may close the down-ladder + dissolve the K663 defect. Plus: Lyra owns her walkback (the X-swap complement rule is the extreme-corner (1-3) output only, not universal).

Keeper | 2026-07-23 | Correcting my own K843 conflation + ratifying two team catches. Plain.

★ CORRECTION (Grace) — I conflated two steps in K843

K843 said “ $\Delta=\hat{D}+d$ IS the 3-strata overlap = the mass operator.” That conflated two DIFFERENT steps: - The descent $\Delta = \hat{D} + d$ gives the K-TYPE / POSITION (the conformal weight Δ , the quantum numbers). Grace’s solid sub-result: $d = 4$ is FORCED — it’s the emergent 3+1 spacetime dimension (banked). “4” has 5 BST forms (coincidence-trap alone), but the descent forces WHICH 4 = the spacetime dimension. One forced number in both $\Delta(\Delta-4)$ and $\Delta=\hat{D}+4$. - The MASS is the OVERLAP NORM (the Γ -ratio of the cone dimensions at the strata positions), NOT the linear Casimir $\Delta(\Delta-4)$. The linear-Casimir-as-mass reading was already caught DEFECTIVE (K663, 07-06) — held at count 8: the Casimir values $\{45,12,0\}$ give $m_b/m_s = 3.45$, and the celebrated “ $m_b/m_s = 45$ ” is a DIFFERENT quantity (Casimir(b)=45 vs observed-ratio ≈ 45 — same number, two meanings, a coincidence). Linear Casimir = wrong shape. So: descent $\rightarrow$ positions; overlap $\rightarrow$ masses. Two steps, not one operator. My K843 was over-stated; corrected.

★ Why the correction is GOOD (the overlap is the right shape)

- Leptons are super-linear: $\{1, 207, 3477\}$ (a Γ -ratio / power-law). Linear Casimir CANNOT be super-linear; the overlap norm IS, by construction (the Gindikin Γ of the cone). So the mass being the overlap (not the Casimir) is exactly what the data demands. This dissolves the K663 defect: the old lead “find one super-linear $F(s)$ ” is answered — it’s the overlap norm.
- ★ BONUS LEAD (Grace) — the down-quark ladder: the same 3-strata overlap applied to the down-quark strata gives $\{1, 20, 900\}$ ($m_s/m_d = 20$ already banked; m_b structure). ONE machinery may close leptons AND the down-ladder — and it dissolves K663 for free. This is NOT the quark-mass swamp (that’s the absolute VALUES / the running); it’s the down-ladder RATIOS via the boundary overlap, which is tractable (leptons are the precedent). Held as a bonus lead — verify the overlap returns $\{1,20,900\}$, don’t assume.

★ Lyra’s walkback (ratified) — the X-swap complement rule is corner-only

Lyra owned Grace’s uniformity catch: the complement rule (leptons carry color, quarks carry rank) is EXACT only for the most-separated pair (the 1-3 angle). Why: those strata sit at opposite ends (deep interior vs boundary) $\rightarrow$ overlap shares nothing longitudinal $\rightarrow$ purely transverse = the clean color-vs-rank swap. Adjacent angles (1-2, 2-3) are between close strata $\rightarrow$ carry a longitudinal piece $\rightarrow$ mixed forms, not the clean rule. So the complement rule is the extreme-corner output, NOT a universal law (F660 over-generalized). The real gate: the single overlap integral must produce ALL six angles (not the rule applied six times). Honest bound.

Corrected convergence + sharpened gates

The one computation = the 3-strata OVERLAP (Lyra, super-linear Γ -ratio), fed by the descent’s POSITIONS (Grace, $d=4$ forced). It lands: lepton masses, all 6 mixing angles, the neutrino self-energy, the glueball spec-

trum — and possibly the down-quark ladder. Gates (emerge, not fit): 1. Muon: norm ratio $N_\mu/N_e \rightarrow 24/\pi^2$ (exponent forced to C_2 — Elie 4805: exact integer 24 ONLY at $C_2=6$). 2. Tau: the $\sqrt{\pi}$ -residue integral produces 71 UNIQUELY (Elie 4806: 71 is rich-vocabulary, 3 forms hit it — must emerge, not be inserted). 3. All 6 mixing angles from the single overlap (not the corner rule $\times 6$). 4. Bonus: down-ladder overlap $\rightarrow \{1,20,900\}$. - Elie's + Grace's checker-halves pre-committed BLIND (commit-the-checker-half-blind discipline). Koide rejected; Five-Absence.

Directions

- ★ LYRA (primary): run the 3-strata OVERLAP integral (K264 Bergman/Gindikin) — the super-linear Γ -ratio at positions $\{5/2, 3/2, 0\}$. Returns the lepton masses ($24/\pi^2$, $49 \cdot 71 - \sqrt{\pi}$), all 6 mixing angles, the neutrino self-energy. The deep machinery reconstruction — the real dive, no faking numbers.
- ★ GRACE: the descent gives POSITIONS (d=4 forced, solid) — feed the K-types/positions to the overlap; hold the blind ledger; check the down-ladder bonus (overlap at down-quark strata $\rightarrow \{1,20,900\}$?).
- ELIE: fire the pre-staged cross-check the instant Lyra's integral lands (muon $24/\pi^2$, tau 71-unique, all pre-registered); glueball K-types.
- CAL/KEEPER: target-innocence; the overlap (not linear Casimir) is the mass; identified $\rightarrow$ derived only if the gates emerge.

— Keeper K844, 2026-07-23. CORRECTION (Grace): descent $\Delta = \hat{D} + d$ gives POSITIONS (d=4=spacetime, forced), NOT mass; the MASS is the OVERLAP (super-linear Γ -ratio) — linear-Casimir-mass is DEFECTIVE (K663). The overlap is the right shape for leptons $\{1,207,3477\}$; BONUS may close the down-ladder $\{1,20,900\}$. Lyra's X-swap complement rule = extreme-corner (1-3) only, not universal (walkback ratified); the single overlap must give all 6 angles. Gates: muon $24/\pi^2$, tau 71-unique, 6 angles from one overlap, down-ladder $\{1,20,900\}$. Lyra runs the overlap; Grace feeds positions + checks the down-ladder; Elie fires pre-staged. See [[Keeper_K843_the_convergence_one_descent_computation_delta_Dhat_plus_d_lands_leptons_PMNS_neutrino_glueballs_sha 07-23]], Grace (descent-vs-overlap catch, K663 defect, down-ladder lead), Lyra (X-swap corner-only walkback), Elie 4805/4806 (blind pre-reg), K663 (linear-Casimir defect, 07-06).
