

BLIND tau tier decision — committed before Move 2 (K980) computes. Value promotes off Fitted ONLY if the $\ell=0$ singular-measure norm produces the ratio FORWARD/blind; “Fitted derived-and-final” is earned ONLY by a POSITIVE proof that no closed form exists, NOT by failure to find one.

K981 — Blind criteria for the tau tier, before Move 2 runs

Move 2 (K980) will compute the tau mass at its $\ell=0$ boundary seat (singular Shilov-vertex measure), in standard-physics linear algebra. It returns one of two outcomes. I commit the tier ruling BLIND now, before Elie’s number, so it can’t be retrofitted.

The two branches, pre-registered

★ BRANCH A — value PROMOTES off Fitted. Earned ONLY if: - A1. The singular-measure norm on the $\ell=0$ boundary projection produces the tau ratio FORWARD (m_τ/m_e , or m_τ/m_μ) — computed from the boundary-mode structure with no peek at 49·71, the $(7/3)^{10/3}$ form, or the measured mass. - A2. The forward number matches observation at a stated precision (report σ , not raw %). - A3. The boundary-mode identification (which physicist object — domain-wall zero mode / limit-of-discrete-series / boundary-dominated eigenvalue) is target-innocent, not chosen because it lands the number. - Result: tau value → IDENTIFIED (or Derived-conditional per the open-piece test if the mechanism is forced), superseding the retired 49·71/10-3 decompositions.

★ BRANCH B — “Fitted DERIVED-and-final”. Earned ONLY if: - B1. A POSITIVE structural proof that the $\ell=0$ singular measure cannot carry a closed-form mass — e.g. the boundary orbit’s measure is a delta/singular distribution whose relevant moment is provably not a finite algebraic combination of the integers $\{2,3,5,7,137\}$. A derivation that the form does not exist, cast as linear algebra on D_{IV}^5 . - B2. The interior modes (μ , e) DO carry closed forms on the smooth measure (the contrast that makes B1 meaningful — boundary vs interior is the whole content). - Result: tau value stays FITTED, but tagged “Fitted (derived-final)” — a positive, publishable statement (the heaviest lepton is the boundary mode; boundary modes have measure-set, not closed-form, masses; 49·71 is a numerical shadow).

★ THE KILL / GUARD (the one way this goes wrong)

“Fitted derived-and-final” (Branch B) is NOT earned by failure to find a form. “We tried the singular-measure norm and couldn’t get a clean number” leaves the tau exactly where it is: FITTED-open, an honest lead, NOT “derived-final.” Branch B requires a *positive* no-closed-form proof (B1), the same way “no 4th generation” required three positive routes, not “we didn’t find a 4th.” Absent B1, the outcome is neither A nor B — it’s status quo (Fitted-open), and Move 2 continues.

Symmetric guard on A: A1’s forward number must be blind; 49·71 reverse-fit onto the measure (finding a measure whose moment happens to be 3479) is FITTED wearing a Derived costume, not Branch A.

Ruling protocol

Keeper rules the tau tier on Move 2 against A1–A3 / B1–B2 verbatim; Cal audits (is the norm computed on the singular measure, forward and blind, or assumed/reverse-fit?). The number does not move these criteria when it lands.

— K981, Keeper, 2026-07-29. Blind tau tier pre-registration for Move 2 (K980): value promotes only on a forward/blind singular-measure ratio; Fitted-final only on a positive no-closed-form proof; failure-to-find $\neq$ derived-final. See [[Keeper_K980_CHARTER_tomorrow_derive_the_tau_at_its_boundary_seat_the_way_standard_physics_would_as_li 07-28]].
