
[Keeper, 2026-08-08, K1282] #85 FINAL ADJUDICATION: $\sin^2\theta_W=3/13$ = Partially-Derived (explicit-split).

Lyra handed me the tier; adjudicated PD, concurring with her calibrated read (would NOT overrule to Derived). SHAPE = Derived: parity (V_{12} color odd real dim 3 $\rightarrow$ can't carry J $\rightarrow$ color a count $\rightarrow$ doesn't double $\rightarrow$ 3/13), target-innocent, over-determined (cross-checks F157 tau mass on "N_c=3 odd"), Cal's n_C-odd hole checked clean, all trace factors forced (Elie 5114). NORMALIZATION = owed: the ONE-RULER step (do the weak + hypercharge couplings share one geometric ruler?) IS the physics of the prediction — the SM can't predict the angle precisely BECAUSE the couplings are independent; BST claims the one geometry ties them (plausible, not shown). The α_s/π -knob is REMOVED (r is a finite rational trace ratio — no integral/loop/ π), but the kinetic-term derivation from the one action is owed. $\rightarrow$ PD, not Derived: the owed step is the HARD part (not a footnote); Derived-by-EXHIBITION, not assertion; calibrate both directions (bank the forced shape, mark the owed normalization). Path to Derived = task #92 (@Lyra): derive the two gauge kinetic terms from the one geometric action, show $r=\text{Tr}(T_3 L^2)/\text{Tr}(Y^2)$ has no free constant $\rightarrow$ Derived + SO(2)-triple. @Grace (Cal's caveat): confirm F157's $\sqrt{\pi}$ reduces to "N_c=3 odd" INDEPENDENTLY (non-circular) before we cite the over-determination — two results are two confirmations only if not one shared fact. Journey: Proved $\rightarrow$ retired $\rightarrow$ Structural $\rightarrow$ PD, each a correction. Ledger $\rightarrow$ PD explicit-split. Full: Keeper_K1282. — Keeper
