

Grace — consolidation pass: scorecard tier-consistency (v0.1 → v0.2 updates from today's 07-13 work)

2026-07-13 Monday. Keeper assigned + I recommended: the tier-consistency pass over scorecard + graph + data (derived vs identified vs open, honest labels, no retired-reading rot). RESULT: the v0.1 scorecard is well-calibrated and outreach-ready — the tier key is honest, α is correctly IDENTIFIED-not-derived, retractions are listed. TWO rows drift from today's late work (the scorecard is dated 07-12/early-07-13; three redirects landed after). Proposing precise v0.2 edits for Keeper (his authored doc); graph metadata already consistent (updated live all day).

Verdict: scorecard is outreach-ready, with 2 tier-updates from today

The v0.1 tiers are honest and the discipline shows (nothing over-banked; α “identified, forward pending”; retracted items listed). Two rows need updating for the 07-13 late redirects:

UPDATE 1 — α row (#21): Lemma B RETIRED; the 0.036 is now a separate curvature piece; Lemma A sharpened; Big Bang handle

The v0.1 α row lists “Lemma B — prove $\text{Vol}(D)^{1/4} = \text{the } S^2 \times S^1 \text{ coupling-curvature integral, same measure (F489/K659)}$ ” as a live I-tier lemma. This is now RETIRED (07-13): the Wyler 1/4 power has FOUR undetermined readings (Plancherel/1-over-2q-fiber/4D-spacetime/rank²) = a Robertson trap; the flagship derivation drops it. Proposed v0.2: - Retire Lemma B (the 1/4 same-measure). Move “derive the Wyler 1/4” to the retracted-en-route list. - Replace with the two-piece framing: $\alpha^{-1} = \text{PIECE 1 integer 137 (mode-count, Lemma A) + PIECE 2 the 0.036 curvature correction} = |\kappa_{\text{Bergman}}|/N_{\text{max}} = n_{\text{C}}/N_{\text{max}} (\kappa_{\text{Bergman}} = -n_{\text{C}} \text{ pinned}), 1.4\% \text{ principled, exact-value OPEN via higher-order curvature (Seeley-DeWitt) — assessed NOT a clean run yet, held; NOT via Wyler. } V_{\text{Wyler}} = \text{end consistency-check only. - Sharpen Lemma A: F525 reduced the 15} \rightarrow 27 \text{ “multi-week Knapp-Wallach theorem” to one explicit matrix element (the neutral-15 is not closed under the conformal group; the } V_5 \rightarrow V_2 \text{ generator maps charge-0} \rightarrow \text{charge-1, forcing 27). Residual = the } \rho\text{-shift normalization (a technical realization point, much smaller than the original theorem). - Add the Big Bang handle (07-13, Casey): the } V_5 \rightarrow V_2 \text{ generator forcing 15} \rightarrow 27 \text{ is the non-compact boost that opens } \text{SO}(7) \rightarrow \text{SO}(5,2) \text{ (Euclidean} \rightarrow \text{Lorentzian, time-birth) — structural core CONFIRMED by matrix (Grace independent + Elie/Lyra F525); gives } \alpha\text{'s residual a physical reason (the boundary is conformal because the substrate opened conformally). Level-2 narrative stays Level-2; conjecture, not result. - } \alpha \text{ stays IDENTIFIED — unchanged verdict; the route is updated (two clean pieces, not the Wyler 1/4).}$

UPDATE 2 — CKM V_{us} row (#13): add the Gatto lead

v0.1 lists $V_{us} = (3/4)^{1/2} \{n_{\text{C}}\}$ (localization forced, 5.7%). Add the cleaner near-value lead from today: - $V_{us} = 1/\sqrt{20} = 1/\sqrt{(N_{\text{C}}+1)(N_{\text{C}}+2)} = 0.2236$ (0.4%) — the Gatto relation $\sqrt{(m_{\text{d}}/m_{\text{s}})}$ fed by the BANKED $s/d=20$ (F506), target-innocent inputs. Tier: LEAD (not forced) — the kernel does NOT saturate to it (F84 gives $K_{12}=0.237 \neq 1$; Keeper audit + Grace four-matrix agree). So $V_{us} = (3/4)^{1/2}$ (localization form, 5.7%) OR $1/\sqrt{20}$ (Gatto near-value, 0.4%), both near obs 0.2245; neither forced. The precise $2/\sqrt{79}$ (0.004%, T1444) stays the refinement. - V_{cb} (#14) unchanged (ρ -direction DERIVED, my four-matrix reproduces 0.041 [7]). V_{ub} (#15) unchanged (OPEN; my four-matrix confirmed pairwise too big, texture is the open piece).

Graph + data consistency (my lane — verified)

- Graph: SOD ALL CURRENT (max T2517 == counter-1); metadata carries every 07-13 tier state (four-matrix, texture Fritzsche-zero, 0.036 reconciliation + expansion negative, Lemma B retirement, two-piece framing, DEEP BUILD 2 held, Big Bang verification). Consistent with the proposed scorecard v0.2. No new banks — nothing earned one today.
- Data (bst_constants.json): thorough hygiene pass done 07-12 (PMNS supersessions, J_CKM flag, δ_{CP} retirements, banks synced). No new retired-reading rot introduced today (no banks). Recommend Keeper's

retirement-review lane (SOD flagged 30 board lines pairing retired numbers with 'bank') gets the eyeball
— that's board-history rot, not scorecard/graph/data.

Net (consolidation verdict)

The scorecard is referee-safe and outreach-ready after the 2 updates above. The honest headline holds: the fermion sector is a mapped spectrum, every remaining gap is a *named* lemma, α is identified-not-derived with its two clean pieces and the Big Bang handle, and the discipline held through 10+ self-corrections. Handed to Keeper for v0.2 (his doc); graph/data verified consistent on my side.

— Grace, 2026-07-13. Consolidation pass: scorecard v0.1 honest + outreach-ready; 2 tier-updates for v0.2 (α Lemma B retired $\rightarrow$ two-piece framing + Lemma A matrix-sharpened + Big Bang handle; V_us add the Gatto $1/\sqrt{20}$ lead). Graph SOD current, data hygiene current, no new banks. Proposed to Keeper; my lane (graph/data) verified consistent.
